### Guide to the coastal marine fishes of California — Calisphere

The California halibut or California flounder (*Paralichthys californicus*) is a large-tooth flounder native to the waters of the Pacific Coast of North America from the Quillayute River in Washington to Magdalena Bay in Baja California. It feeds near shore and is free swimming. It typically weighs 6 to 30 pounds (3 to 23 kg).

### Guide To The Coastal Marine Fishes of California

Coastal fish, also called inshore fish or neritic fish, inhabit the sea between the shoreline and the edge of the continental shelf. Since the continental shelf is usually less than 200 metres deep, it follows that pelagic coastal fish are generally epipelagic fish, inhabiting the sunlit epipelagic zone. Coastal fish can be contrasted with oceanic fish or offshore fish, which inhabit the deep seas beyond the continental shelves. Coastal fish are the most abundant in the world. They can be found

### Striped Mullet (*Mugil cephalus*) - Species Profile

All but two species (the thorny heads *Sebastolobus alascanus* and *Sebastolobus altivelis*, or idiots) are included in the genus *Sebastes*. These species are collectively or individually called rockfish, rockcod, snapper, sea bass, and other names. Identification of rockfish species is desirable for good management.
