If a particle or body is acted upon only by conservative forces energy is conserved. This means that the total kinetic and potential energy in the system remains constant, and does not change. Such a system has no friction forces acting on it, and as such is an idealized simplification for solving problems using energy calculations.

Conservation of energy applies only to isolated systems. A ball rolling across a rough floor will not obey the law of conservation of energy because it is not isolated from the floor. The floor is, in fact, doing work on the ball through friction. However, if we consider the ball and floor together, then conservation of
