The cost of production in an industry depends on the rate of output which is important in economic analysis of cost.the relationship between cost and output determines the cost function. Once the cost function is determined estimates of future cost of production at various output levels can usually be obtained. 11.

Let s = selling price per unit v = variable cost per unit FC = fixed cost per period Q = volume of production The total sales revenue (S) of the firm is given by the following formula: $S = s Q$ The total cost of the firm for a given production volume is given as $TC = \text{Total variable cost} + \text{Fixed cost} = v Q + FC$.

Engineering Economics & Cost Analysis

Some examples of engineering economic problems range from value analysis to economic studies. Each of these is relevant in different situations, and most often used by engineers or project managers. For example, engineering economic analysis helps a company not only determine the difference between fixed and incremental costs of certain operations, but also calculates that cost, depending upon a number of variables.
