HANDBOOK OF LASER TECHNOLOGY & APPLICATIONS
JOHN C. MORRISON, in Modern Physics, 2010. Light-emitting diodes and semiconductor lasers typically have gratings or etched ridges in which light is reflected or transmitted many times at the interface between different materials. The amplitudes of light at the interface of two semiconductors with indices of refraction, n1 and n 2, the chapter derives expression for the transmission and reflection amplitudes, t and r, for a single interface between two dielectric materials, it also considers ...

Handbook of Laser Technology and Applications
Commercial semiconductor lasers are all III-V compounds — alloys of Group III and Group V elements in the periodic table. There are two major commercial families of semiconductor lasers — those grown on GaAs substrates and those grown on InP substrates.

Semiconductor Lasers: An Overview of Commercial Devices ...
The modulation speed of semiconductor laser is limited by mainly two factors, relaxation frequency and parasitic impedance. For 10 Gbps application, we first reduced parasitic impedance to improve electric bandwidth. The trench shown in Fig. 3 was buried by BCB (Benzocyclobutene) to reduce parasitic capacitances of the device.

Development of Semiconductor Laser for Optical Communication
The height of the lines and bars gives an indication of the maximal power/pulse energy commercially available, while the color codifies the type of laser material (see the figure description for details). Most of the data comes from Weber's book Handbook of laser wavelengths, with newer data in particular for the semiconductor lasers.

List of laser types - Wikipedia
The semiconductor laser is very small in size and appearance. It is similar to a transistor and has the operation like LED but the output beam has the characteristics of laser light. The material which often used in semiconductor laser is the gallium Arsenide, therefore semiconductor laser is sometimes known as Gallium Arsenide Laser.

The first p-n junction lasers were built in GaAs (infrared) and GaAsP (visible) in 1962, and this made the laser an important part of semiconductor device technology. Today lasers are used in many different areas such as communication, industry, medicine, and environmental care and research.

Semiconductor Lasers
A laser diode, (LD), injection laser diode (ILD), or diode laser is a semiconductor device similar to a light-emitting diode in which a diode pumped directly with electrical current can create lasing conditions at the diode's junction. Laser diodes can directly convert electrical energy into light.
