Coordinate grid paper aka Cartesian grid or plane paper is used for plotting points in four quadrants on a coordinate plane. It can also be used for transformations that involve more than one quadrant. Many people use it for "Cartesian Art" where students plot points in a given order and join each point to the previous

one with a line segment.

(x 2,y 2), the slope calculator substitutes the values into this equation to calculate the "rise" on the top and the "run" on the bottom. When choosing between your two points, it doesn't matter which point is used as (x 1,y 1) or (x 2,y 2), but it is very important that you consistently use the respective individual coordinates within each point.

In geometry, the rhombicuboctahedron, or small rhombicuboctahedron, is an Archimedean solid with eight triangular, six square, and twelve rectangular faces. There are 24 identical vertices, with one triangle, one square, and two rectangles

meeting at each one. (Note that this shape can have squares as the rectangular faces, but to be an archimedian solid, they have to be squares.)

Rhombicuboctahedron - Wikipedia A regular grid is a tessellation of ndimensional Euclidean space by

congruent parallelotopes (e.g. bricks). Grids of this type appear on graph paper and may be used in finite element analysis, finite volume methods, finite difference methods, and in general for discretization of parameter spaces. Since the derivatives of field variables can be conveniently expressed as finite differences
