The Routing Information Protocol (RIP) is one of the oldest distance-vector routing protocols which employs the hop count as a routing metric. RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from source to destination. The largest number of hops allowed for RIP is 15, which limits the size of networks that RIP can support.

Routing Information Protocol - Wikipedia

1.2.144.0: 2010/05/07: Version 1.2: First release of our new high-performance JPEG decoder, currently used for raw preview JPEG extraction (up to 50% faster!) 1.1.143.0: 2010/05/01: FPV x64 fix for poor GPU mode performances with some high-end graphic cards. Added two new conditions to the batch file processor plug-in. 1.1.142.0: 2010/04/26

FriendlyARM NanoPi R2S Under Construction! This page is currently under construction. You can edit the article to help completing it. The NanoPi R2S uses the RK3328 SoC with two Gbps Ethernet ports and 1G DDR4 RAM. Usually inexpensive, this makes for a good cheap gateway router. If needed, wireless can be provided by a supported USB2 WiFi dongle.
