The key point for the heat transfer coefficient is the heat conduction through the boundary layer δ on the tube. $\alpha = \lambda / \delta$ (W/m² K) In media having poor heat conductivity λ , for instance, gases or for high viscous materials with larger boundary film thickness δ , the heat load Q can be improved by an outer area enlargement.

Computer cooling is required to remove the waste heat produced by computer components, to keep components within permissible operating temperature limits. Components that are susceptible to temporary malfunction or permanent failure if overheated include integrated circuits such as central processing units (CPUs), chipsets, graphics cards, and hard disk drives.
