A stepper motor is an electrical motor that turn in steps, this is in contrast to a conventional motor that moves smoothly. The steps are measured in degrees and vary from motor to

many phases tend to have much lower levels of vibration,[3] although the cost of manufacture is higher. These motors tend to be called 'hybrid' and have more expensive machined parts, but also higher quality bearings.

A stepper motor may

have several coils but they are wired together and controlled in phases. Two, Four and Five phase stepper motors are common. There will often be a phase diagram included with a stepper motor that indicates the sequence that the motor phases are driven in.

A stepper motor, also known as step motor or stepping motor, is a brushless DC electric motor that divides a full rotation into a number of equal steps. The motor's position can then be commanded to move and hold at one of these steps without

Stepper motor drive circuits Stepper motor performance is

strongly dependent on the drive circuit.

Torque curves may be extended to greater speeds if the stator poles can be reversed more quickly, the limiting factor being the winding inductance. To overcome the inductance and switch the windings quickly, one must increase the drive voltage.
