V2020 fixed displacement pumps are of Vickers "balanced vane type" construction. V10 and V20 single pumps have rated flow capacities of 1 to 7 USgpm and 6 to 13 USgpm, respectively. Double pumps provide a single power source capable of serving two separate hydraulic circuits, or of providing greater volume through the combined delivery

These vane pumps have been specially designed for high/low circuit. The combination of different cartridges in double and triple pumps allows low flow at high pressure (300 bar max.) and high flow at lower pressure. This is a clever way to optimize your circuit design. This pump feature will also allow a very fast pressure cycle change with a very pre-

Twelve vane system provides low amplitude flow pulsations resulting in low system noise characteristics. Hydraulic balancing, designed to prevent internally-induced radial shaft and bearing loads, provides long life. Double pumps and thru-drive arrangements save installation space and cost by eliminating double shaft extension electric motors or by

A balanced vane pump is a very versatile design that has found widespread use in both industrial and mobile applications. The basic design principle is shown in Fig. The rotor and vanes are contained within a double eccentric cam ring and there are two inlet segments and two outlet segments during each revolution.

Vane Pumps - Types, Working, Diagram, Advantages

Vane-type fuel pumps are the most common types of fuel pumps found on reciprocating-engine aircraft. They are used as both engine-driven primary fuel pumps and as auxiliary or boost pumps. Regardless, the vane-type pump is a constant displacement pump that moves a constant volume of fuel with each revolution of the pump.
